TASK 5: CYBERCRIME CASE STUDY

Student Digital Ambassador – Phishing Focus

1. Introduction to Task 5

As a Student Digital Ambassador, understanding and advocating for cybersecurity is a foundational responsibility. Task 5 focuses on applying the security principles from Module 5 to a pervasive and highly relevant threat in the academic and professional world. For this case study, I selected Phishing as the core topic, aiming to analyze its distinct methodologies and provide actionable prevention strategies for my peers. This task bridges the gap between theoretical knowledge of cyberthreats and the practical skills needed for safe and responsible digital participation.

2. Detailed Phishing Analysis & Prevention Methodology

Instead of a broad overview, I focused my analysis on a specific, sophisticated variant: Credential Harvesting via Spear-Phishing.

Attack Vector Analysis:

- I deliberately analyzed the multi-staged approach used in these attacks. My analysis covers how malicious actors use deceptive email subject lines, emotional manipulation (like creating a false sense of urgency), and technically spoofed 'From' addresses to trick users. I also detailed how attackers create fraudulent login pages.
